Boston | (857) 396-9652 | akshathaagopalakrishna@gmail.com | linkedin.com/in/akshathaa-gopalakrishna

SUMMARY

AI-native operations professional who uses AI as the default tool for research, troubleshooting, analysis, and automation rather than as an occasional aid. Track record of identifying broken processes, proposing fixes, and shipping improvements without waiting for direction. Comfortable owning execution under ambiguity, partnering directly with engineering to automate recurring manual work, and tracking operational KPIs to drive continuous improvement.

SKILLS

AI and Automation: OpenAI API, Claude, LangChain, ChatGPT, Python automation, prompt engineering, workflow automation, AI-assisted research and troubleshooting

Operations and Execution: Exception handling, cross-functional coordination, process documentation, SOP development, KPI tracking, bottleneck identification, playbook development

Analytics and Reporting: SQL, Power BI, Excel, Python, data quality analysis, root cause analysis, performance monitoring

Tools and Platforms: Airtable, Zendesk, Jira, Notion, Asana, Google Workspace, Confluence, Git, Microsoft Office Suite

EXPERIENCE

Product Operations and Quality Management Co-op, Boston Metal | Woburn, MA

Jan 2025 – Sep 2025

- Used AI as the default tool for daily operational work, including research, troubleshooting complex data issues, drafting process documentation, and building automation workflows that eliminated recurring manual tasks; reduced manual processing time by 60% by identifying the right automation opportunities and shipping solutions without waiting for engineering direction.
- Spotted a broken process independently, traced a 40% data quality gap distorting executive resource allocation through SQL root cause analysis, proposed and coordinated the fix with engineering, and implemented monitoring controls to catch recurrence automatically rather than escalating and waiting.
- Improved the operational playbook week over week, documenting what worked, flagging what didn't, and shipping process improvements across 7 to 8 cross-functional teams; built 15 standardized SOPs and a 200+ document management system that teams could follow without hand-holding.
- Tracked operational KPIs including cycle time, throughput, backlog aging, and defect trends across concurrent workstreams, using data to surface problems early and drive improvement decisions rather than reporting after the fact.
- Partnered directly with engineering and product teams to turn recurring manual work into automated workflows using Python and OpenAI API pipelines, communicating clearly across technical and non-technical stakeholders in the same conversation.
- Stayed calm and organized under shifting priorities, managing multiple concurrent operational workstreams simultaneously while keeping stakeholders informed and escalating with judgment only when something genuinely couldn't wait.

Technical Product Management Intern, Tata Elxsi | Bengaluru, India

Jun 2021 – Jul 2023

- Managed daily execution across 15 concurrent feature workstreams in a fast-moving Agile environment, using AI tools to research issues, draft communications, and troubleshoot delivery blockers across engineering, product, and QA teams simultaneously.
- Called out process problems early and came with proposed solutions, improving UAT and defect triage workflows that reduced post-launch issues across product releases.
- Conducted competitive analysis across 20 products, using AI-assisted research to synthesize findings faster and deliver structured recommendations to leadership.

PROJECTS

AI-Assisted Operations Automation and Playbook System

2025

- Built Python and OpenAI API automation workflows to eliminate recurring manual operational tasks, documented the playbook end to end, and iterated on the process weekly based on real usage; designed for handoff so the system ran without ongoing involvement.

Operational KPI Tracking and Exception Detection System

2025

- Designed SQL and Power BI infrastructure to track operational KPIs in real time, automatically surface anomalies and exceptions before they became delivery problems, and give leadership and operations teams early visibility into performance trends.

EDUCATION

Northeastern University, College of Engineering | *Master of Science in Engineering Management* | Boston, MA

Relevant Coursework: Data Analytics, Operations Management, Systems Engineering, Product Development, Data Mining.

Vidyavardhaka College of Engineering | *Bachelor of Engineering in Information Science*
